

TEXT / SMS WATCHLIST ALARMS

SAFR provides enhanced situational awareness without the need for additional hardware or personnel. Ensure you never miss a person of interest with automated monitoring and SMS Watchlist Alarms.

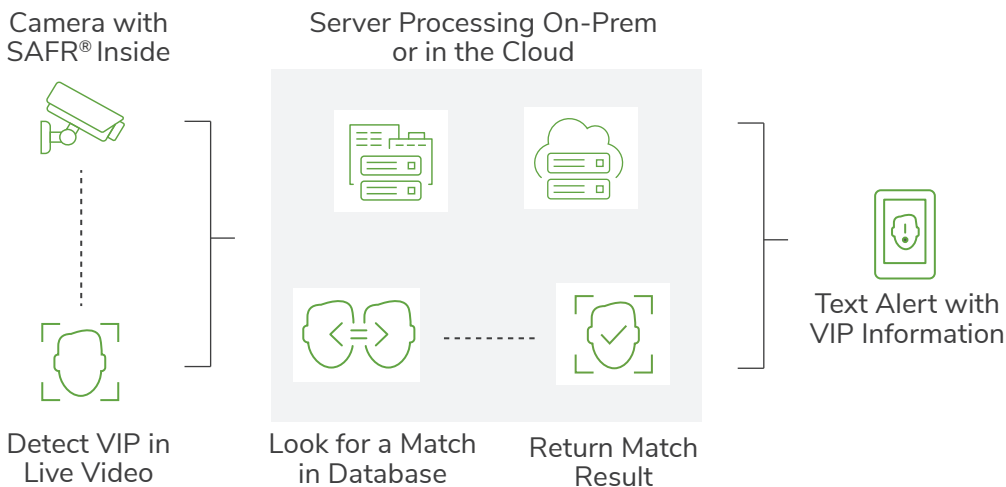

SAFR's algorithm effectively matches faces appearing on live video feeds against watchlist images — with less bias and error than human operators — freeing up security personnel to manage emerging incidents in real time and giving them information and alerts to respond to persons of interest more quickly.

With SMS Watchlist Alarms, customers have the ability to configure SMS notifications based on a specific set of event conditions. Security personnel receive an SMS alert – no matter where they are – when a VIP or person of concern is detected within a defined area.

TOP FEATURES:

- Notifications can be configured based on a combination of person type (VIP, threat, concern), specific location being monitored, and the security personnel who will receive the SMS message.
- Active 24/7
- Frequency of notifications are adjustable
- Available to Windows and Cloud users
- Integrated out-of-the-box for Cloud and SAFR[®] Inside customers

HOW IT WORKS

99.87% recognition accuracy

Match speeds under 100 milliseconds

24/7 Monitoring
